

In-class assignments

- Please rewrite the following code fragment using a *break* statement and eliminating the **done** variable. Your code should behave identically to the code provided (i.e., the outputs should be the same).
- After the revision above, further revise the code to count and print how many even numbers the user provides.

```
done = False
n, m = 0, 100
while not done and n != m:
    n = int(input())
    if n < 0:
        done = True
    print("n =", n)
```
